

Automotive SaaS Sales Engineer Demo Deck

Alan C. De Guzman | alandeguzman.com | Static simulated-AI portfolio demos

This deck supports a live Sales Engineer interview demo. It summarizes the portfolio, the buyer problem, the demo flow, proof-of-value framing, and honest boundaries for the static simulated-AI workflow tools.

Positioning

- 17 years of BMW/MINI/Honda dealership diagnostic experience translated into customer-facing software workflow demos.
- Best-fit roles: Sales Engineer, Solutions Consultant, Customer Engineer, Technical Account Manager, and Implementation Consultant.
- Target markets: automotive SaaS, fleet, telematics, diagnostics, EV service, fixed ops, warranty, roadside, and service workflow platforms.
- Core message: I can translate technician, shop, fleet, and OEM problems into workflows customers understand.

Demo Portfolio

Diagnostic Workflow Assistant	Flagship command-center demo for symptoms, DTCs, scan observations, safety checks, root-cause ranking, buyer impact, and talk tracks.
Service Advisor Estimate Generator	Converts technician findings into customer-safe advisor language, estimate assumptions, urgency, next steps, and objection handling.
OBD Fault-Code Triage Tool	Maps fault-code context to affected systems, red flags, dispatch questions, and escalation logic for fleet/support workflows.
Integration Scoping Assistant	Turns vague API requests into discovery questions, data-object validation, risk ownership, PoV metrics, and implementation handoff notes.

Flagship Demo: Diagnostic Workflow Assistant

Portfolio workflow demo for automotive SaaS, fleet, telematics, diagnostics, and EV service teams

Buyer Problem

- Diagnostic cases often start with messy intake: customer complaint, DTCs, intermittent symptoms, safety constraints, scan observations, and operational pressure.
- Technical and non-technical stakeholders need different explanations, but they need to agree on the same next step.
- Fleet, support, and service teams need repeatable proof that the workflow reduces ambiguity, downtime, repeat contacts, and wrong-part risk.

Live Demo Flow

- Open the MINI EV case and show the case summary, risk level, confidence, estimated labor, parts assumption, and simulated signal snapshot.
- Run the workflow and walk through the safety gate, validation table, root-cause ranking, next tests, advisor explanation, and OBD triage.
- Switch buyer persona, then show how the impact language and demo script change for fleet, service, support, or executive buyers.
- Use search to highlight DTCs, systems, root causes, and workflow steps. Open the full workflow modal for interview deep dives.

Proof-of-Value Angle

- Measure diagnostic intake time, repeat clarification loops, escalation completeness, vehicles returned to service, and avoided wrong-part spend.
- Pilot on repeat high-friction diagnostic categories before trying to generalize across every repair type.
- Position the workflow as technician-validated support, not replacement for OEM procedures or qualified judgment.

Secondary Demos

Additional interview surfaces showing workflow translation beyond one flagship demo

Service Advisor Estimate Generator

- Shows how a technician finding becomes customer-safe language, estimate assumptions, urgency, and next-step guidance.
- Useful for dealer SaaS, fixed ops, warranty, customer success, and service-lane quality conversations.
- Proof metrics: advisor call time, approval clarity, declined-work reasons, follow-up clarifications, and documentation completeness.

OBD Fault-Code Triage Tool

- Shows why a DTC is a clue rather than a conclusion.
- Maps DTCs to likely affected systems, red flags, questions before dispatch, and remote-support handoff notes.
- Proof metrics: time to triage, false dispatches, complete escalations, and vehicles kept in service.

Integration Scoping Assistant

- Shows Sales Engineer discovery for API and partner workflow requests.
- Captures source and target systems, auth model, cadence, data objects, risk ownership, PoV metrics, and implementation handoff.
- Proof metrics: setup time, manual re-checks, alert trust, stakeholder signoff, and implementation blocker reduction.

Sales Engineer Talk Track

Use this structure in recruiter screens, panel interviews, and live demo sessions

5-Minute Version

- Problem: automotive service data is messy and loses context across technician, advisor, support, and fleet handoffs.
- Demo: open the diagnostic workflow, run a case, and show root causes, safety checks, buyer impact, and advisor language.
- Value: the product story is faster triage, cleaner handoffs, better trust, and measurable proof-of-value.

15-Minute Version

- Start with discovery: who owns the workflow, where does context get lost, and what does downtime or repeat contact cost?
- Run the flagship demo and show the dashboard, workflow path, validation table, root-cause ranking, and persona-specific business impact.
- Close with a pilot plan: pick one high-friction diagnostic category, measure intake quality and cycle time, then expand based on proof.

30-Minute Version

- Go deeper into stakeholder-specific messaging, implementation assumptions, data boundaries, safety boundaries, and proof metrics.
- Show the secondary demos to prove the same thinking applies to advisor communication, fault-code triage, and API/integration scoping.
- Use the deck and one-pager as leave-behind materials after the live demo.

Build Notes and Boundaries

Clear, truthful framing for public recruiters and interviewers

How It Is Built

- Static browser-only portfolio hosted on GitHub Pages at alandeguzman.com.
- No backend, no stored credentials, no OpenAI API key, no external AI call, and no live vehicle data connection.
- Uses deterministic JavaScript case logic, fictional sanitized examples, dynamic UI state, generated PDFs, screenshots, and a short walkthrough GIF.

Claims To Make

- I built these demos to show Sales Engineer workflow thinking, technical communication, discovery, proof-of-value framing, and buyer translation.
- The demos reflect my diagnostic experience and software training, but they are not production diagnostic software.
- All repair, safety, and technical conclusions require qualified technician validation and OEM procedures.

Best Interview Close

"My background gives me the field credibility to understand the customer's world, and these demos show how I can turn that credibility into technical discovery, product storytelling, and a proof plan a buyer can evaluate."
